Professional relations with patients	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Ethical conduct	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Sense of professional responsibility	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Timely and complete recordkeeping	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

It is **REQUIRED** that you provide specific comments and recommendations below. Please be as specific as possible, including reports of critical incidents and/or outstanding performance.

III. DEFINITION OF PAIN MEDICINE

The specialty of Pain Medicine, or Algiatry, is a discipline within the field of medicine that is concerned with the prevention of pain, and the evaluation, treatment, and rehabilitation of persons in pain. Some conditions may have pain and associated symptoms arising from a discrete cause, such as postoperative pain or pain associated with a malignancy, or may be conditions in which pain constitutes the primary problem, such as neuropathic pains or headaches.

Pain Medicine specialists use a broad-based approach to treat all pain disorders, ranging from pain as a symptom of disease to pain as the primary disease. The pain physician serves as a consultant to other physicians but is often the principal treating physician (as distinguished from the primary care physician) and may provide care at various levels, such as treating the patient directly, prescribing medication, prescribing rehabilitative services, performing pain-relieving procedures, counseling patients and families, directing a multidisciplinary team, coordinating care with other health care professionals and providing consultative services to public and private agencies pursuant to optimal health care delivery to the patient suffering with pain. The objective of the pain physician is to provide quality care to the patient suffering with pain. The pain physician may work in a variety of settings and is competent to treat the entire range of pain encountered in delivery of quality health care.

Pain Medicine specialists typically formulate comprehensive treatment plans, which consider the patients' cultural contexts, as well as the special needs of the pediatric and geriatric populations. Evaluation techniques include interpretation of historical data; review of previous laboratory, imaging, and electrodiagnostic studies; assessment of behavioral, social, occupational, and avocational issues; and interview and examination of the patient by the pain specialist.
